Experience

Finaptive June 2025 – Present

Forward Deployed Engineer

- Own the technical lifecycle for **15+ client deployments** across ERP platforms (SAP, Costpoint, Blackbaud, Xero, SFTP), from initial discovery calls with CFOs through production go-live and ongoing optimization
- Designed an **AI-driven classification engine** using Claude API to map unstructured client data to standardized financial schemas, constrained by deterministic validation to ensure accurate reconciliation
- Led Finaptive's **PointClickCare marketplace integration** end-to-end, owning the technical validation calls, implementing API safeguards, and building a webhook-driven incident alert system serving **10 healthcare facilities** with structured reporting, timezone handling, and graceful degradation
- Built a **connector framework** supporting OAuth2, REST, mTLS, ODBC, and SFTP that replaced one-off integration work with **zero-code onboarding**, saving **15-25 hours** of engineering per new client deployment
- Architected a **dispatcher-executor fan-out pipeline** that uses Celery and Redis, implementing isolated queues, distributed locking for idempotency, and rate-limit retry logic cutting processing time by **87%**
- Enabled the job orchestration system to handle **5M+ financial records/day**, autoscaling **concurrent workers** on queue depth in Kubernetes, with room for **30X** current load under existing infrastructure

Finaptive Feb 2025 – May 2025

Software Engineer Intern

- Built the initial ETL pipeline, transformation workflows, validation checkpoints, and **Celery RedBeat** scheduling for automated background ingestion across client ERP environments
- Built Data Preview, a client-facing web tool (Flask, JavaScript) that lets clients inspect and validate upstream data before full runs, later shipped to every connector and reducing bad-transfer support tickets

AMD May 2023 – April 2024

Design Automation Engineer Intern

- Developed automation tooling in Python and C Shell, eliminating **20+ hours** of weekly validation work across hardware design workflows
- Led code reviews and static analysis across **10+ hardware design projects**, identifying **100+ critical defects** and improving cross-team code quality standards
- Enhanced the **observability and operability** of infrastructure by developing a real-time dashboard (PHP/JS) to visualize test results and **identify system risks**

Projects

Agentic Outreach Pipeline | *Python, Claude API, SQL*

- Architected an **8-stage agentic pipeline** where **2 tool-calling agents** handle contact research and drafting while deterministic code owns every consequence, with human approval enforced by architecture
- Built an **LLM-as-judge** qualification gate scored over **300+ live postings**, with frozen anchor postings in every batch as drift alarms, matching real interview outcomes in ground-truth evaluation

Lunar Landing Reinforcement Learning Hackathon (1st Place) | *Python, PyTorch*

- Implemented a reinforcement learning agent with Actor-Critic architecture, PPO clipping, and Generalized Advantage Estimation, achieving a test reward of **285.3 (1st / 50+ teams)**
- Optimized model performance through **hyperparameter tuning** and trust-region updates, improving agent efficiency by **29.8%**

Technical Skills

Languages: Python, JavaScript/TypeScript, HTML/CSS, C/C++, PHP
Frameworks & Libraries: Flask, Celery, Pandas, Pydantic, PyTorch, Asyncio, React, Claude API
Databases & Messaging: PostgreSQL, SQL, Redis, MongoDB, MySQL
Cloud & DevOps: Azure (App Service, Container Apps, Key Vault), Docker, Kubernetes, GitHub Actions, Linux
Concepts & Tools: Distributed Systems, API Integrations, Webhooks, Data Modeling, ETL Pipelines, CI/CD

Education

McMaster University Hamilton, ON

Bachelor of Engineering in Electrical Engineering *June 2025*
